Warning

Very toxic to aquatic life with long lasting effects.
Keep out of reach of children.
Ireland only: To protect aquatic organisms respect an unsprayed buffer zone of 5 m to surface water bodies.
UK only: Dispose of contents/container to a licensed hazardous waste disposal contractor or collection site except for empty, clean containers which can be disposed of as non-hazardous waste.
Ireland only: Dispose of contents/container to a licensed waste disposal contractor or collection site except for triple rinsed, empty containers which can be disposed of as non-hazardous waste.
To avoid risks to human health and the environment, comply with the instructions for use.
**SHOTPUT®**

**MAPP 15968 PCS 04071**

**DIRECTIONS FOR USE:**
full instructions in this leaflet.
Batch No.: see packaging

---

**SAFETY PRECAUTIONS**

**Operator Protection**

UK only: Engineering control of operator exposure must be used where reasonably practicable in addition to the following personal protective equipment.

*WEAR SUITABLE PROTECTIVE GLOVES AND SUITABLE RESPIRATORY PROTECTIVE EQUIPMENT* when handling the product.

*Disposable filtering facepiece respirator to at least EN149 FFP3 or equivalent. WEAR SUITABLE PROTECTIVE GLOVES when handling contaminated surfaces.

UK only: However, engineering controls may replace personal protective equipment if a COSHH assessment shows they provide an equal or higher standard of protection.

WASH CONCENTRATE from skin or eyes immediately.

DO NOT BREATHE SPRAY. WHEN USING DO NOT EAT, DRINK OR SMOKE.

Wash all protective clothing after use.

---

**Environmental Protection**

Do not contaminate water with the product or its container. Do not clean application equipment near surface water. Avoid contamination via drains from farmyards and roads.

To protect aquatic organisms respect an un sprayed buffer zone to surface water bodies in line with LERAP requirements.

DO NOT ALLOW DIRECT SPRAY from horizontal boom sprayers to fall within 5 metres of the top of the bank of a static or flowing water body, unless a Local Environment Risk Assessment for Pesticides (LERAP) permits a narrower buffer zone (UK only), or within 1 metre of the top of a ditch which is dry at the time of application. Aim spray away from water.

UK only: This product qualifies for inclusion within the Local Environmental Risk Assessment for Pesticides (LERAP) scheme.

---

**IMPORTANT INFORMATION**

FOR PROFESSIONAL USE ONLY AS AN AGRICULTURAL HERBICIDE

**Crops:** Potato - earlies and maincrop

Maxim um individual dose

Maxim um total dose

Latest time of application

Full details are given in the information box within this leaflet.

**Other specific restrictions**

A minimum of 21 days must be observed between applications.

A maximum total dose of 0.35 kg a.s./ha/season (0.50 kg SHOTPUT/ha/season) may be applied post-emergence of the crop. Do not apply via handheld equipment.

READ THE LABEL BEFORE USE. USING THIS PRODUCT IN A MANNER THAT IS INCONSISTENT WITH THE LABEL MAY BE AN OFFENCE. FOLLOW THE CODE OF PRACTICE FOR USING PLANT PROTECTION PRODUCTS.
A residual herbicide for control of weeds in potatoes.
A water dispersible granule formulation containing 70% w/w metribuzin.

UK only: This product qualifies for inclusion within the Local Environmental Risk Assessment for Pesticides (LERAP) scheme. Before each spraying operation from a horizontal boom sprayer, either a LERAP must be carried out in accordance with HSE’s published guidance or the statutory buffer zone must be maintained. The results of the LERAP must be recorded and kept available for three years.

Extreme care must be taken to avoid spray drift onto non-crop plants outside of the target area.

Storage and Disposal
KEEP IN ORIGINAL CONTAINER, TIGHTLY CLOSED, IN A SAFE PLACE.
KEEP AWAY FROM FOOD, DRINK AND ANIMAL FEEDINGSTUFFS.
EMPTY CONTAINER COMPLETELY and dispose of safely.

DIRECTIONS FOR USE
IMPORTANT: This information is approved as part of the Product Label. All instructions within this section must be read carefully in order to obtain safe and successful use of this product.

GENERAL INFORMATION
SHOTPUT® is both a contact and residual herbicide. It can be used to control weeds in named varieties pre-emergence and, in certain varieties, post-emergence. A list of varieties which may be treated is summarised below. For the latest information, please consult Adama Agricultural Solutions UK Ltd representatives.

SHOTPUT should not be used if a previously applied residual herbicide still remains in the soil. This is especially significant on organic soils.

RESTRICTIONS
Avoid drift as SHOTPUT may damage sensitive crops especially sugar beet, brassicas and lettuce.

Do not apply SHOTPUT to crops suffering from disease, stress or nutrient deficiencies or that are cold, waterlogged or grown in acidic conditions.

Care should be taken to avoid spray overlap, as crop damage may occur which may not be outgrown.

SOIL TYPES AND CONDITIONS
Do not use SHOTPUT on sands.

Do not use SHOTPUT pre-emergence on Maris Piper in very light soils and do not treat this variety post-emergence.

Tubers should be planted in a moist, clod-free bed with a good tilth with well-rounded ridges. After planting, no further improvements should be required to the soil tilth; further cultivations will increase weed germination and reduce the effectiveness of SHOTPUT.

The soil should be moist when spraying. Dry conditions may reduce the effectiveness of SHOTPUT.

The residual activity of SHOTPUT may be reduced on peaty and organic soils and on mineral soils with high organic matter content.

WEATHER
Yellowing of foliage may occur as a result of treatment, which is more frequent if spraying is carried out less than 3 days after cool cloudy weather and particularly if a sudden change to hot sunny conditions occurs at the time of spraying. The crop should outgrow this yellowing.

In conditions of high sunlight intensity and high daytime temperatures, spraying should be carried out in the evening.

On gravelly or stony soils damage may occur particularly if heavy rain falls soon after application.
**FOLLOWING CROPS**

Before drilling or planting the next crop, the soil must be mould-board ploughed to a depth of at least 15 cm. It is recommended that ploughing takes place as soon as possible after lifting and definitely before the end of December.

The following intervals must be observed between application of SHOTPUT and drilling or planting the following crops:

- **Cereals, ryegrass, winter beans:** 16 weeks
- **All crops except lettuce and radish:** the following spring
- **Lettuce and radish:** these crops should not be grown in the year after SHOTPUT treatment.

Contact Adama Agricultural Solutions UK Ltd in the event of crop failure due to poor growing conditions.

**RESISTANCE**

SHOTPUT contains metribuzin a triazinone belonging to HRAC group C1.

Always follow WRAG guidelines for preventing and managing herbicide resistant weeds.

Maximise the use of cultural control measures wherever possible (e.g. crop rotation, ploughing, stale seedbeds, delayed planting, etc.)

Use tank-mixes or sequences of herbicides with different modes of action within individual crops.

Copies of the guidelines may be obtained from the CPA (UK only), your distributor, crop advisor or product manufacturer.

For further advice on resistance management, contact Teagasc, your agronomist or specialist advisor.

**POTATO VARIETIES**

Not all varieties of potato may be safely treated with SHOTPUT. For the latest list of potato varieties which may be treated with SHOTPUT contact Adama Agricultural Solutions UK Ltd

Varieties which may be treated:

| First earlies, pre-emergence | Alcmaria, Arran Comet, Ostara, Maris Bard, Pentland Javelin, Ulster Sceptre, Orla |
| Second earlies, pre-emergence | Ausonia, Estima, Marfona, Maris Peer, Nadine, Wilja |
| Maincrop, pre-emergence | Maris Piper*, Asterix, Markies, Mayan Gold, Melody, Rooster, Shannon, Vales Sovereign |
| Maincrop, pre- and post-emergence | Cara, Desiree, King Edward, Kingston, Pentland Crown, Pentland Dell, Pentland Squire, Record, Romano, Claret, Isle of Jura, Vales Everest, Vivaldi |

*not on Sands or Very Light soils.

**WEEDS CONTROLLED**

In the Weed Susceptibility table which follows,

- **S** = susceptible, **MS** = moderately susceptible,
- **R** = resistant, **-** = insufficient information

* Post-emergence weed control up to 1 expanded true leaf is recorded in the table; however most annual broad-leaved weeds will be controlled beyond this stage.

# See section: Specific Weed Situations.

Perennial broad-leaved weeds and grasses are not controlled by SHOTPUT.

</table>
Specific weed situations

Early germinating weeds
For best control, apply SHOTPUT between the cotyledon to one true leaf stage.
Black-bindweed is best controlled at the cotyledon to 2 true leaf stage. It is less sensitive to pre-emergence treatments.

Late germinating weeds, including black-bindweed
A post-emergence application may be made to listed safe main crop varieties before leading shoots reach 15 cm. Efficacy of SHOTPUT on black-bindweed is improved with post-emergence applications.

Perennial grasses
If the potato crop follows grass, then either a suitable herbicide and/or cultivations should be used to kill the sward in the autumn. Following weeds can then be controlled using SHOTPUT post-emergence on recommended maincrop varieties. SHOTPUT will suppress common couch when applied post-emergence up to the two leaf stage.

CROP SPECIFIC INFORMATION

Traditional Method
Overall application (not incorporated) pre-emergence to recommended earlies varieties and pre- or post-emergence to recommended maincrop varieties. Persistence and residual activity and weed control may be less than the listed susceptibilities in maincrops grown on all soil types and earlies grown on all soil types except very light and light soils.

# See Specific Timings and Application Methods below.
* Soil Classification ADAS 85 system.

Do not use SHOTPUT on potatoes grown in sand soils.

Water volumes

Traditional method:
Use a minimum of 200 litres of water per hectare using a Medium Quality spray (as defined by BCPC). Where the soil is cloddy, it is advisable to increase the volume of water.

For post-emergence application use a minimum of 130 litres of water per hectare and a Fine Quality spray (as defined by BCPC).

Application
Apply pre- or post-emergence to the soil surface. Even coverage of both sides of the ridge is important. Care should be taken in particular with post-emergence applications where the crop is sheltering the weeds; it is essential that the spray penetrates the canopy. Do not apply SHOTPUT in windy conditions.

Filters should be at least size 80 mesh. Filters finer than 80 mesh should not be used.
Specific timings and application methods

Incorporation of SHOTPUT into the soil
On soils containing greater than 10% organic matter and on mineral soils under dry conditions, SHOTPUT should be incorporated at a rate of 0.75 kg/ha into the top 10-15 cm of soil during the final cultivation. This gives increased activity and is especially advantageous for those varieties which cannot be treated post-emergence. This method is particularly useful to increase activity on soils with more than 10% organic matter.

Pre-planting: On soils containing greater than 10% organic matter and on mineral soils in dry conditions, apply 0.75 kg/ha of SHOTPUT, incorporating into the top 10-15 cm of soil during the final cultivation. Suitable cultivators are rotary harrows, rotary cultivators or spring tine harrows. A suitable granular nematicide may be incorporated into the soil at the same time, in accordance with the manufacturer’s recommendations. After planting, ridging up should occur as soon as possible. It is important that ridges do not incorporate untreated soil which would allow weeds to establish. A final ridging up may be made, before the crop meets across the rows.

For recommended maincrop potatoes grown in two-row beds only, a follow-up post-emergence treatment of up to 0.5 kg/ha of SHOTPUT may be applied. This will give useful control of late germinating weeds in the furrows.

Post-planting: Place the tubers in shallow ridges and apply 0.75 kg/ha of SHOTPUT. Before the crop emerges, incorporate by cultivating shallowly while at the same time ridging up. The cultivator should be fitted with suitable ridging bodies. In the case of second early varieties this application may only be made on soils containing more than 10% organic matter.

A further application of up to 0.5 kg/ha of SHOTPUT will be needed to control later germinating weeds. The second application may also be applied post-emergence before the leading shoots of the potatoes are 15 cm long.

Post-emergence applications
This method is for use on recommended maincrop varieties only. The method is only recommended until the weeds reach the cotyledon stage. If weeds are beyond this stage control may be reduced.

Rate of Use: On recommended varieties only, make 1 application at 0.35-0.5 kg/ha.

Timing: Application should be carried out at or before early cotyledon stage of the weeds until the most advanced shoots of the potatoes are 15 cm long.
SHOTPUT should be used pre-emergence on crops destined for use as seed.

Temporary plastic mulches
Using the traditional method of application, early potatoes may be treated with SHOTPUT and covered with plastic mulches. Since effective control of weeds by SHOTPUT is dependent on soil moisture, it is important that crops are well irrigated before the mulch is applied. Application should also be made to well-prepared, clod-free ridges. If using this method on mineral soils with a high organic matter content the residual activity of SHOTPUT may be reduced. This may result in inadequate weed control.

MIXING AND APPLICATION
For use by tractor mounted/trailed sprayer only.
Add half the required amount of water to the spray tank and begin agitation. Add the recommended quantity of SHOTPUT. On emptying the container, RINSE CONTAINER THOROUGHLY by using an integrated pressure rinsing device or manually rinsing three times. Add washings to sprayer at time of filling, through the filter basket, and dispose of container safely. Maintain agitation throughout the filling, travelling and spraying operations. Dilute solutions should be sprayed immediately. After spraying, thoroughly clean the sprayer using a recognised decontaminant.
Crops should not be re-entered until spray residues are dry.
Ireland only: For information on tank-mixes, consult Adama Agricultural Solutions UK Ltd, your agronomist or your distributor.
DISCLAIMER/CONDITIONS OF SUPPLY

The specified properties of our products and the mode of application stated on this label have been established on the basis of research and experience. Products conform to specification at the time of delivery but, as we exercise no control over their subsequent storage, handling, mixing or use or the weather conditions before, during and after application, all of which may affect the performance of the products, no responsibility or liability will be accepted by us or our re-sellers for any failure in performance, damage or injury to person or property whatsoever arising from the storage, handling, application or use of the products. These conditions cannot be varied by our staff or agents whether or not they supervise or assist in or make recommendations concerning the use of such products. We recommend you contact your dealer to request advice on the suitability of this product for any new and/or unusual growing methods or for new varieties not listed on this label.

Other specific restrictions:
This product must not be applied by hand-held equipment.
An aquatic buffer zone of 5 m is required for extensions of use (for further information see ‘Safety Precautions’).
For sweet potatoes, the maximum total dose must not exceed 0.35 kg a.s./ha/season (0.5 kg product/ha/season) when applied post-emergence of the crop.

Outdoor crops of carrot, parsnip and mallow:
SHOTPUT may be used for the control of wild mignonette and fool’s parsley in outdoor crops of carrot, parsnip and mallow (Althaea officinalis).
Applications of SHOTPUT are to be applied via conventional hydraulic sprayers in a minimum water volume of 200 litres per hectare.
Applications must not be made during flowering or where bees are actively foraging.
A minimum interval of 21 days must be observed between applications.
Use only on carrot and mallow crops that will be mechanically harvested, treated crops must not be hand-harvested.

Outdoor sweet potato:
SHOTPUT may be used as for the control of broad-leaved weeds and grass weeds in outdoor crops of sweet potato. Applications must be made in a minimum of 200 litres of water.

Growers are advised to test a small area of crop before use.
A minimum interval of 21 days must be observed between applications.
The maximum total dose must not exceed 0.35 kg a.s./ha/season (0.5 kg product/ha/season) when applied post-emergence of the crop.

Outdoor asparagus:
SHOTPUT may be used for the control of annual and perennial weeds in outdoor asparagus.
Applications to outdoor asparagus are to be made via conventional hydraulic sprayers, including air assisted hydraulic sprayers in a minimum water volume of 200 litres per hectare.
A minimum interval of 14 days must be observed between applications.
