

Rotation Options for Your Acreage

Providing Flexibility to Grow Profits

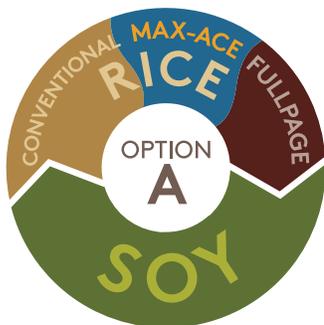

It has long been a common practice for farmers to vary the crops grown in each field from year to year. Rotating crops can have important benefits such as increasing yields, improving nutrients and organic matter in the soil, and disrupting the lifecycle of crop pests like grasses and weeds.

To preserve rice herbicide-tolerant (HT) systems, it's important to rotate rice with other crops like soybeans or crawfish. The different weed control strategies used with these other crops helps keep your fields clean and protects the HT technology for the future.

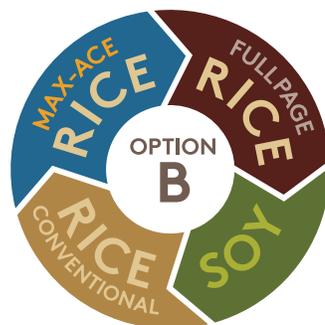

See below for recommended rotational strategies for FullPage® and Max-Ace® Rice Cropping Solutions.

Remember to always start clean and never leave any weedy rice in your fields.

CROP ROTATIONS

ROTATE BETWEEN CHOSEN RICE & SOYBEAN CROPS based on what will maximize yield returns while minimizing herbicide resistance through different modes of action. Best bet to increase the longevity of herbicide-tolerant technology.

INCLUDE SOYBEANS IN THE ROTATION for growers who choose a herbicide residual program and want to maximize number of rice plantings, season after season.*

TAKE ADVANTAGE OF SEASONALITY and get two crops in one year. Rotate crawfish between any of the rice options shown above.

*Observe rotational limitations for preceding year's herbicide plan.
